Practical no.1

1] visible part of computer

a)cabinet:The vertical or horizontal metal box that houses the "brain" of the computer The vertical or horizontal metal box that houses the "brain" of the computer

b)monitor:The display screen that shows visual output like text, pictures, and videos.

c)keyboard:An input board with buttons (keys) used to type letters, numbers, and commands.

d)Mouse: A small handheld pointing device that controls the cursor on your screen so you can click, drag, and open files

d)speakers:External output devices connected to the computer to produce sound, allowing you to hear music, videos, and alerts.

2]hardware part of computer

a)CPU (Central Processing Unit): The "brain" of the computer that handles all processing, arithmetic calculations, and system commands

b)Motherboard: The main circuit board that connects and allows communication between all internal and external components.

c)Hard Disk (HDD / SSD): The permanent storage device where your operating system, software programs, and personal files are saved.

d)RAM (Random Access Memory): The temporary, high-speed working memory that stores data currently being used by open applications.

e)ROM (Read-Only Memory): The permanent, unchangeable memory containing the vital startup instructions (BIOS) required to boot up the computer.

3]input and output storage devices.

a]input:Keyboard, Mouse, Microphone, Webcam

b)output:Monitor, Speakers, Printer, Headphones

☆ storage devices :HDD, SSD, RAM, USB Flash Drive

4]file management

a)Step 1: Create a New FolderRight-click on an empty space on your Desktop or inside any folder.Hand

over your mouse over New in the menu that appears. Click on Folder. Type a name for your folder and press Enter

b) Step 2: Create and Edit a File

1. Double-click your newly created folder to open it.
2. Right-click on an empty space inside the folder window.
3. Hand over New and select the type of file you want (e.g., Text Document or Microsoft Word Document)
4. Type a name for your new file and press Enter.
5. Double-click the file to open it in an editor (like Notepad or Word).
6. Type or edit your text inside the file. [1, 2, 3, 4, 5]

Step 3: Save the File Click on File in the top-left corner of the program menu. Click Save (or press the keyboard shortcut Ctrl + S on Windows, or Cmd + S on Mac).

When you right-click a file and select Properties, a window opens featuring several tabs (or "tabs") across the top. Each tab provides specific information and control settings for that file. Files type, extract size, date.

Open your document in Microsoft Word or Excel. Click File in the top-left corner. Select Info from the side menu. Click the Protect Document (or Protect Workbook) button. Choose Encrypt with Password. Type your password, click OK, re-type it to confirm, and Save the file

5] introduction to internet:

The Internet is a massive, global network of millions of interconnected computers, servers, and smart devices that communicate with one another to share information.

* history of internet: The history of the internet spans over sixty years, evolving from a secure military research project into a massive global network. Unlike many physical inventions, the internet was not built by a single person; instead, it grew through decades of collaborative engineering

* basic step of internet: To use or navigate the internet, a computer goes through a series of technical communication steps every time you request a webpage or app. Connection (The Physical Link) Request (The URL Lookup) Translation (The DNS Search) Routing (The Data Travel) Response (The Page Display)

* Common DNS Record Types Every domain name has specific configuration files called DNS Records stored on its authoritative server. The most common types include: address record, txt record, mx record.

* internet vs web developer: The Internet is the massive, global physical highway infrastructure of interconnected computers and cables, while Web Development is the specialized practice of building and

coding the actual websites and applications that travel along that highway. [1, 2, 3, 4]

Many people use these terms interchangeably, but they are different:

- The Internet: The physical infrastructure—the massive global network of cables, routers, and servers.

6]. How Data Travels (The Basics) When you request a website, your device acts as a client. It sends a request to the Domain Name System (DNS) to find the computer address (IP address) of the web server.
